A: Search is Case-Insensitive. Change your query from WHERE `title` LIKE "%Duende Native Plug-in Suite 3.6.6 VST VST3 RTAS%" to WHERE `title` LIKE "%Duende NATIVE PLUG-IN Suite 3.6.6 VST VST3 RTAS%" You will need to change the LIKE to ILIKE for MySQL. This will work with any field types. A: Grammar: The LIKE clause can be used to perform a case-insensitive search. In MySQL, the LIKE clause can be used to perform a case-insensitive search for text in the first argument. To do case-sensitive searches, use a case-sensitive collation. The CAST() function can be used to force a collation to be treated as case-sensitive. Q: Why BCL classes fail to load under Mono? I have a simple

---

class that goes like this: [Serializable] public class Person { public string Name { get; set; } public int Age { get; set; } } And I have a simple assembly that registers this class like this: [assembly: XmlSerializerFormat("MyNamespace")] [XmlRoot("Person")] public class Person { [XmlAttribute] public string Name { get; set; } [XmlAttribute] public int Age { get; set; } } In .NET I get a nice person xml file that looks like this: Alexander 32 In .NET, as I understand it, the XmlSerializer is creating an XML document that is the type of my Person class. The serializer then attempts to write this XML document to a string, and the resulting string contains the text MyNamespace. In Mono, however, when

There is no PC Xcode for download Solid State Logic - Duende Native Plug-in Suite 3.6.6 [VST-VST3-RTAS] 0 download settings support. solid state logicQ: How to send javascript array to flask json object So I am making a mobile app using the Echo mobile framework and I have a file that contains javascript to create a keyboard for the app. I want to send that array to flask so that I can return the text to the user in a jquery effect. Here is the code in the html I think it might have something to do with json( for the flask object).

Here is the code in the flask @app.route('/approve', methods=['GET', 'POST']) @login\_required def approve(): type\_of\_approval = request.json['type\_of\_approval'] if type\_of\_approval == 'entrance': data = {'approved': True,
